Ctrl+K

AppBar

The AppBar displays information and actions relating to the current screen.

Design and Development tips in your inbox. Every weekday.

ads via Carbon

The top AppBar provides content and actions related to the current screen. It's used for branding, screen titles, navigation, and actions.

It can transform into a contextual action bar or be used as a navbar.

App bar with search field

A side searchbar.

The screenshot shows a code editor interface with a blue header bar. On the left of the header is a three-line menu icon. Next to it, the text "MUI" is displayed. To the right of "MUI" is a search bar containing a magnifying glass icon and the placeholder text "Search...". Below the header, there are several tabs: "Edit in Chat" (highlighted in blue), "JS", and "TS". To the right of these tabs are buttons for "Hide code", a lightning bolt (refresh), a 3D cube (copy), a square (download), a circular arrow (refresh), and a vertical ellipsis (more options).

```

App bar with a primary search field

A primary searchbar.

The screenshot shows a blue header bar with the MUI logo. On the left is a menu icon (three horizontal lines). In the center is a search input field with a magnifying glass icon and the placeholder "Search...". On the right are three vertical dots. Below the header, there's a toolbar with various icons: a gear, a refresh, a search, a file, a copy, a paste, a C, and a more options icon. At the bottom, there are two tabs: "Edit in Chat" (selected) and "TS". The main content area contains the following code:

```

import * as React from 'react';
import { styled, alpha } from '@mui/material/styles';
import AppBar from '@mui/material/AppBar';
import Box from '@mui/material/Box';
import Toolbar from '@mui/material/Toolbar';

  },
  {
    id: 3,
    primary: 'Recipe to try'.
  }
]
```

Fixed placement

When you render the app bar position fixed, the dimension of the element doesn't impact the rest of the page. This can cause some part of your content to be invisible, behind the app bar. Here are 3 possible solutions:

1. You can use `position="sticky"` instead of `fixed`.
2. You can render a second `<Toolbar />` component:

```
function App() {
  return (
    <React.Fragment>
      <AppBar position="fixed">
        <Toolbar>{/* content */}</Toolbar>
      </AppBar>
      <Toolbar />
    </React.Fragment>
  );
}
```

`Copy`

3. You can use `theme.mixins.toolbar` CSS:

```
const Offset = styled('div')(({ theme }) => theme.mixins.toolbar);

function App() {
  return (
    <React.Fragment>
      <AppBar position="fixed">
```

`Copy`

```
<Toolbar>{/* content */}</Toolbar>
</AppBar>
<Offset />
</React.Fragment>
);
}
```

Scrolling

You can use the `useScrollTrigger()` hook to respond to user scroll actions.

Hide App bar

The app bar hides on scroll down to leave more space for reading.

Scroll to hide App bar

import useScrollTrigger from '@mui/material/useScrollTrigger';
import Box from '@mui/material/Box';
import Container from '@mui/material/Container';
import Fab from '@mui/material/Fab';
import KeyboardArrowUpIcon from '@mui/icons-material/KeyboardArrowUp';
import Fade from '@mui/material/Fade';

interface Props {
    /**
     * Injected by the documentation to work in an iframe.
     * You won't need it on your project.
     */
    window?: () => Window;
    children?: React.ReactElement<unknown>;
}

function ScrollTop(props: Props) {
    const { children, window } = props;
    // Note that you normally won't need to set the window ref as useScrollTrigger
    // will default to window.
    // This is only being set here because the demo is in an iframe.
    const trigger = useScrollTrigger({
        target: window ? window() : undefined,
        disableHysteresis: true,
        threshold: 100,
    });
}
```

```
const handleClick = (event: React.MouseEvent<HTMLDivElement>) => {
  const anchor = (
    (event.target as HTMLDivElement).ownerDocument || document
  ).querySelector('#back-to-top-anchor');

  if (anchor) {
```

```
useScrollTrigger([options]) => trigger
```

Arguments

1. `options` (*object*[optional]):

- `options.disableHysteresis` (*bool*[optional]): Defaults to `false`. Disable the hysteresis. Ignore the scroll direction when determining the `trigger` value.
- `options.target` (*Node*[optional]): Defaults to `window`.
- `options.threshold` (*number*[optional]): Defaults to `100`. Change the `trigger` value when the vertical scroll strictly crosses this threshold (exclusive).

Returns

`trigger`: Does the scroll position match the criteria?

Examples

```
import useScrollTrigger from '@mui/material/useScrollTrigger';

function HideOnScroll(props) {
  const trigger = useScrollTrigger();
  return (
    <Slide in={!trigger}>
      <div>Hello</div>
    </Slide>
  );
}
```

Copy

Enable color on dark

Following the [Material Design guidelines](#), the `color` prop has no effect on the appearance of the app bar in dark mode. You can override this behavior by setting the `enableColorOnDark` prop to `true`.
